SHORTENED STATUTORY PERIOD OF RESPONSE	MAIL DATE	DELIVERY MODE
3 MONTHS	03/02/2007	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

Office Action Summary

Application No.

10/606,333

Applicant(s)

KOGA ET AL.

Examiner

Dennis G. Bonshock

Art Unit

2173

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 26 June 2003.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-34 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-34 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 07 November 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____.
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____.

DETAILED ACTION

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 2-4 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Regarding claim 2, the phrase "such a" renders the claim indefinite because it is unclear whether the limitations following the phrase are part of the claimed invention. See MPEP § 2173.05(d).

Claims 3 and 4 recite the limitation "the functions" in line 5. There is insufficient antecedent basis for this limitation in the claim.

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1, 2, 6, 7, 11, 12, and 14-16 are rejected under 35 U.S.C. 102(e) as being anticipated by Gunn et al., Pub. No.: US 2005/0210402, hereinafter Gunn.

Art Unit: 2173

3. With regard to claim 1, which teaches a display control device comprising: a display control section adapted to display a plurality of button groups each having at least one button in a monitor connected thereto and to display any of the buttons displayed in the monitor in focused state; Gunn teaches, in paragraphs 125 and 128, a system comprising a plurality of button groups where when a button group is displayed on the monitor, one of the buttons is displayed in a focused state. With regard to claim 1, which further teaches a button change section including an in-group button changing operation unit adapted to change the button to be focused from one button to another within the button group, Gunn teaches, in paragraph 10, changing the current focus within a button group. With regard to claim 1, which further teaches an inter-group button changing operation unit adapted to change the button to be focused from a button of one button group to a button of another button group, Gunn teaches, in paragraphs 125 and 128, changing button groups and further changing the focus to the most likely button in the changed to button group. With regard to claim 1, which further teaches wherein, when the button to be focused is changed by the inter-group button changing operation unit from the button of one button group to the button of another button group, the display control section displays a specific button of the button group changed in focused state, Gunn teaches, in paragraphs 125 and 128, a specific button of the changed to group of buttons is displayed in or near the center providing it with specific focus, this focus item could additionally be displayed in a different color, font, or boldness to signify its focus (see paragraph 160).

Art Unit: 2173

4. With regard to claim 2, which teaches wherein the display control section displays such a base ring in the monitor as is formed in an information display portion for displaying various information, and displays the buttons arranged around the base ring by dividing the buttons into the button groups, Gunn teaches, in paragraphs 126 and 127 and in figures 10-12, displaying a base ring for the selected group of buttons and a group of buttons surround it.

5. With regard to claim 6, which teaches wherein the display control section displays ten keys as one of the button groups, Gunn teaches, in paragraphs 127 and 128, the varying of the number of keys displayed and a numeric keypad which contains keys 0-9. With regard to claim 6, which teaches wherein when the button to be focused is changed by the inter-group button changing operation unit from a button of one button group to a button of the ten keys, the display control section displays the specific button in the ten keys in focused state, Gunn teaches, in paragraphs 125 and 128, a changing of the group of keys to be presented, where one of the keys is displayed in a focus state.

6. With regard to claim 7, which teaches wherein the display control section applies the specific button to a button indicating "0" in the ten keys, Gunn teaches, in paragraphs 125 and 128 and in figure 11, one of the plurality of keys in the key group has focus, where the example places "0" in the focus.

7. With regard to claim 11, which teaches wherein the in-group button changing operation unit is operated in an array direction of the buttons in the button groups so that the button displayed in focused state is to be moved from one button to another

Art Unit: 2173

button displayed in the array direction within an identical button group by the display control section, Gunn teaches, in column 126 and 126 and in figures 10-12, a button array where a second most likely group of candidates is displayed in a ring around the focus element, each element adjacent to a similarly likely candidate, so that if the focus must be changed the additional elements are specially close.

8. With regard to claim 12, which teaches, wherein the inter-group button changing operation unit is operated in an array direction of the button groups so that the button displayed in focused state is to be moved from one button in one button group to a button of another button group displayed in the array direction by the display control section, Gunn teaches, Gunn teaches, in column 126 and 126 and in figures 10-12, a button array where a second most likely group of candidates is displayed in a ring around the focus element, and a further group of candidates less likely displayed in a ring around the second most likely group of candidates, so that if the focus must be changed the additional elements are specially close.

9. With regard to claim 14, which teaches wherein the display control section displays the button selected by the button change section in focused state by displaying highlighted, Gunn teaches, in paragraph 160, displaying the button to be focused with a different level of boldness and color.

10. With regard to claim 15, which teaches wherein the display control section displays the button selected by the button change section in focused state by displaying enlarged, Gunn teaches, in paragraph 160, displaying the button to be focused with a different font.

Art Unit: 2173

11. With regard to claim 16, which teaches wherein the display control section displays the button selected by the button change section in focused state by changing the display color of the focused button, Gunn teaches, in paragraph 160, displaying the button to be focused with a different color.

Claim Rejections - 35 USC § 103

12. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

13. Claims 3, 4, 13, 17, 21-26, and 30-34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gunn et al., Pub. No.: US 2005/0210402, hereinafter Gunn and Do, Patent No.: US 6,417,869.

14. With regard to claim 3, which teaches wherein the display control section comprises a processing unit adapted to execute software application programs, and wherein the display control section displays and divides the button groups for the functions of the software application programs to be executed by the processing unit, and applies the specific button to a button for executing a frequently used function in the button groups, Gunn teaches, in paragraphs 125 and 128, a system comprising a plurality of button groups, where when a button group is selected for display on the monitor, one of the buttons is displayed in a focused state based on which one is most commonly used, and in paragraph 52, a processing unit for executing software

Art Unit: 2173

applications. Gunn, however, doesn't specifically teach a particular button group pertaining to a particular software application. Do teaches, a system for providing a plurality of different button groups on a display, similar to that of Gunn, but further teaches, in column 7, line 10, through column 8, line 30, providing different button groups based on a particular application program selected. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Do before him at the time the invention was made to modify grouped buttons of Gunn to be associated with particular applications, as did Do. One would have been motivated to make such a combination because different applications have different relevant keys.

15. With regard to claim 4, which teaches wherein the display control section comprises a processing unit adapted to execute software application programs, and wherein the display control section displays and divides the button groups for the functions of the software application programs to be executed by the processing unit, and applies the specific button to a button for executing a main function in the button groups, Gunn teaches, in paragraphs 125 and 128, a system comprising a plurality of button groups, where when a button group is selected for display on the monitor, one of the buttons is displayed in a focused state based on which one is most commonly used, and in paragraph 52, a processing unit for executing software applications. Gunn, however, doesn't specifically teach a particular button group pertaining to a particular software application. Do teaches, a system for providing a plurality of different button groups on a display, similar to that of Gunn, but further teaches, in column 7, line 10, through column 8, line 30, providing different button groups based on a particular

Art Unit: 2173

application program selected. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Do before him at the time the invention was made to modify grouped buttons of Gunn to be associated with particular applications, as did Do. One would have been motivated to make such a combination because different applications have different relevant keys.

16. With regard to claim 13, Gunn teaches, in paragraphs 125 and 128, a system comprising a plurality of button groups, where when a button group is selected for display on the monitor, one of the buttons is displayed in a focused state, but doesn't specifically teach a remote controller separated from the display control section, wherein the button change section is disposed in the remote controller. Do teaches, a system for providing a plurality of different button groups on a display (see column 7, line 10, through column 8, line 30), similar to that of Gunn but further teaches, in column 7, lines 49-54, the system comprising a remote control which can enter numbers there by effecting the predicted set. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Do before him at the time the invention was made to modify predictive group element display of Gunn to include the remote control for optional entry as did Do. One would have been motivated to make such a combination because this provides the user with a means of effecting an input to the system without the need to be directly in front of the system.

17. With regard to claim 17, which teaches display control device comprising: a display control section adapted to display in a monitor connected thereto ten keys composed of a plurality of buttons for inputting a telephone number and a

Art Unit: 2173

communication button for starting a telephone communication, and to display any of the ten keys and the communication button displayed in the monitor in focused state; Gunn teaches, in paragraphs 125 and 128, a system comprising a plurality of button groups where when a button group is displayed on the monitor, one of the buttons is displayed in a focused state. Gunn teaches, in paragraphs 127 and 128, the varying of the number of keys displayed and a numeric keypad, which contains keys 0-9. With regard to claim 17, which further teaches a button change section adapted to change the button to be focused from one button to another, wherein the display control section displays a specific button of the ten keys in focused state when the ten keys previously not displayed are displayed in the monitor, Gunn teaches, in paragraphs 125 and 128, changing button groups and further changing the focus to the most likely button in the changed to button group. Gunn teaches, in paragraphs 125 and 128, a specific button of the changed to group of buttons is displayed in or near the center providing it with specific focus, this focus item could additionally be displayed in a different color, font, or boldness to signify its focus (see paragraph 160), but doesn't specifically teach the use of the system for a telephone communication. Do teaches, a system for providing a plurality of different button groups on a display (see column 7, line 10, through column 8, line 30), similar to that of Gunn but further teaches, in paragraph 7, lines 36-60, utilizing a numeric pad similar to that in Gunn to implement a telephone communication. Do teaches the system accepting a numeric keys for a telephone call known in the art to comprise ten keys [(XXX) XXX-XXXX] and further remembering the last entered 10 keys for a redial function. Do further teaches, in column 7, lines 49-54, the system

Art Unit: 2173

further comprising a dial button for initiating a call and obviously creating a new last dialed number for later redial. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Do before him at the time the invention was made to modify grouped buttons of Gunn to be associated with particular applications such as a telephone application, as did Do. One would have been motivated to make such a combination because different applications have different relevant keys, in this case the numeric pad, as taught by both reference is utilized in Do to conduct a phone conversation, with past dialed numbers being preserved for further use.

18. With regard to claims 21 and 30, which teach wherein the display control section applies a button indicating "0" of the ten keys to the specific button, Gunn teaches, in paragraphs 125 and 128 and in figure 11, one of the plurality of keys in the key group has focus, where the example places "0" in the focus.

19. With regard to claims 22 and 31, which teach wherein the display control section applies a button of the ten keys indicating the numeral of the telephone number to be normally dialed firstly, Gunn teaches, in paragraphs 66, 125, and 128, providing focus for the number most likely to be entered based on past frequency of use.

20. With regard to claims 23 and 32, which teach wherein the display control section displays the button selected by the button change section in focused state by displaying highlighted, Gunn teaches, in paragraph 160, displaying the button to be focused with a different level of boldness and color.

21. With regard to claims 24 and 33, which teach wherein the display control section displays the button selected by the button change section in focused state by displaying

Art Unit: 2173

enlarged, Gunn teaches, in paragraph 160, displaying the button to be focused with a different font.

22. With regard to claims 25 and 34, which teach wherein the display control section displays the button selected by the button change section in focused state by changing the display color of the focused button, Gunn teaches, in paragraph 160, displaying the button to be focused with a different color.

23. With regard to claim 26, which teaches a display control device comprising: a display control section adapted to display in a monitor is connected thereto a plurality of buttons for inputting a telephone number and a communication button for starting a communication, and to display any of the ten keys and the communication button displayed in the monitor in focused state; Gunn teaches, in paragraphs 125 and 128, a system comprising a plurality of button groups where when a button group is displayed on the monitor, one of the buttons is displayed in a focused state. Gunn teaches, in paragraphs 127 and 128, the varying of the number of keys displayed and a numeric keypad, which contains keys 0-9. With regard to claim 26, which teaches a button change section adapted to change the button to be displayed in focused state from one button to another, wherein when the communication button is displayed in focused state and when the button to be displayed in focused state is changed by the button change section from the communication button to the button of the ten keys, the display control section displays a specific button of the ten keys in focused state, Gunn teaches, in paragraphs 125 and 128, changing button groups and further changing the focus to the most likely button in the changed to button group. Gunn teaches, in paragraphs 125

Art Unit: 2173

and 128, a specific button of the changed to group of buttons is displayed in or near the center providing it with specific focus, this focus item could additionally be displayed in a different color, font, or boldness to signify its focus (see paragraph 160), but doesn't specifically teach the use of the system for a telephone communication. Do teaches, a system for providing a plurality of different button groups on a display (see column 7, line 10, through column 8, line 30), similar to that of Gunn but further teaches, in paragraph 7, lines 36-60, utilizing a numeric pad similar to that in Gunn to implement a telephone communication. Do teaches the system accepting a numeric keys for a telephone call known in the art to comprise ten keys [(XXX) XXX-XXXX] and further remembering the last entered 10 keys for a redial function. Do further teaches, in column 7, lines 49-54, the system further comprising a dial button for initiating a call and obviously creating a new last dialed number for later redial. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Do before him at the time the invention was made to modify grouped buttons of Gunn to be associated with particular applications such as a telephone application, as did Do. One would have been motivated to make such a combination because different applications have different relevant keys, in this case the numeric pad, as taught by both reference is utilized in Do to conduct a phone conversation, with past dialed numbers being preserved for further use.

Art Unit: 2173

24. Claims 5 and 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gunn et al., Pub. No.: US 2005/0210402, hereinafter Gunn and Cirne, Patent No.: 5,625,763.

25. With regard to claim 5, which teaches wherein the display control section comprises a button memory unit adapted to memorize a button that was focused immediately before the button to be focused is changed by the inter-group button changing operation unit from a button of one button group to a button of another button group, and wherein when the button to be focused is changed by the inter-group button changing operation unit from a button of the another button group to a button of the one button group, the display control section displays the button memorized in the button memory unit in focused state, Gunn teaches, in paragraphs 125 and 128, a system comprising a plurality of button groups, where when a button group is selected for display on the monitor and a button group change can take effect where an entire button set is switched out for another one, and whenever a button set is displayed one of the buttons is displayed in a focused state, but doesn't specifically teach the memorizing of a button of focus before a group change and further remembering the focus button when the original button group regains focus. Cirne teaches a system where user interface items are grouped and presented to a user as a group, where one of the items of the group is given particular focus (see column 4, lines 65 through column 5, line 20), similar to that of Gunn, but further teaches saving a current focus item in a group window, so that when the dialog returns to the window the focus can be directed to the same item. It would have been obvious to one of ordinary skill in the art,

having the teachings of Gunn and Cirne before him at the time the invention was made to modify grouped icon display with specific focus of Gunn to include the memorization of a groups focus as did Cirne. One would have been motivated to make such a combination because this allows for directing a focus to the same item when a group window is reopened.

26. With regard to claim 8, which teaches wherein the display control section comprises a button memory unit adapted to memorize a button that was focused immediately before the button to be focused is changed by the inter-group button changing operation unit from a button of the ten keys to a button of another button group, and wherein when the button to be focused is changed by the inter-group button changing operation unit from a button of the another button group to a button of the ten keys, the display control section displays the button memorized in the button memory unit in focused state, Gunn teaches, in paragraphs 125 and 128, a system comprising a plurality of button groups, where when a button group is selected for display on the monitor and a button group change can take effect where an entire button set is switched out for another one, and whenever a button set is displayed one of the buttons is displayed in a focused state, but doesn't specifically teach the memorizing of a button of focus before a group change and further remembering the focus button when the original button group regains focus. Cirne teaches a system where user interface items are grouped and presented to a user as a group, where one of the items of the group is given particular focus (see column 4, lines 65 through column 5, line 20), similar to that of Gunn, but further teaches saving a current focus item in a group window, so that

Art Unit: 2173

when the dialog returns to the window the focus can be directed to the same item. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Cirne before him at the time the invention was made to modify grouped icon display with specific focus of Gunn to include the memorization of a groups focus as did Cirne. One would have been motivated to make such a combination because this allows for directing a focus to the same item when a group window is reopened.

27. Claims 9, 10, 18-20, and 27-29 rejected under 35 U.S.C. 103(a) as being unpatentable over Gunn et al., Pub. No.: US 2005/0210402, hereinafter Gunn, Do, Patent No.: US 6,417,869, and Cirne, Patent No.: 5,625,763.

28. With regard to claims 9, 19, and 28, Gunn teaches, in paragraph 120, a button change section used for establishing focus. Gunn further teaches, in paragraphs 125 and 128 and in figure 11, one of the plurality of keys in the key group has focus, where the example places "0" in the focus. Gunn teaches, in paragraphs 125 and 128, a system comprising a plurality of button groups, where when a button group is selected for display on the monitor, one of the buttons is displayed in a focused state, but doesn't specifically teach the use of the system for a telephone communication.

29. Do teaches, a system for providing a plurality of different button groups on a display (see column 7, line 10, through column 8, line 30), similar to that of Gunn but further teaches, in paragraph 7, lines 36-60, utilizing a numeric pad similar to that in Gunn to implement a telephone communication. Do teaches the system accepting a numeric keys for a telephone call known in the art to comprise ten keys [(XXX) XXX-

Art Unit: 2173

XXXX] and further remembering the last entered 10 keys for a redial function. Do further teaches, in column 7, lines 49-54, the system further comprising a dial button for initiating a call and obviously creating a new last dialed number for later redial. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Do before him at the time the invention was made to modify grouped buttons of Gunn to be associated with particular applications such as a telephone application, as did Do. One would have been motivated to make such a combination because different applications have different relevant keys, in this case the numeric pad, as taught by both reference is utilized in Do to conduct a phone conversation, with past dialed numbers being preserved for further use. However, neither Gunn nor Do teach memorizing the button displayed in focus for later use.

Cirne teaches a system where user interface items are grouped and presented to a user as a group, where one of the items of the group is given particular focus (see column 4, lines 65 through column 5, line 20), similar to that of Gunn, but further teaches saving a current focus item in a group window, so that when the dialog returns to the window the focus can be directed to the same item. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Cirne before him at the time the invention was made to modify grouped icon display with specific focus of Gunn to include the memorization of a groups focus as did Cirne. One would have been motivated to make such a combination because this allows for directing a focus to the same item when a group window is reopened.

Art Unit: 2173

30. With regard to claims 10, 20, and 29, Gunn teaches, in paragraph 120, a button change section used for establishing focus. Gunn further teaches, in paragraphs 125 and 128 and in figure 11, one of the plurality of keys in the key group has focus, where the example places "0" in the focus. Gunn teaches, in paragraphs 125 and 128, a system comprising a plurality of button groups, where when a button group is selected for display on the monitor, one of the buttons is displayed in a focused state, but doesn't specifically teach the use of the system for a telephone communication.

Do teaches, a system for providing a plurality of different button groups on a display (see column 7, line 10, through column 8, line 30), similar to that of Gunn but further teaches, in paragraph 7, lines 36-60, utilizing a numeric pad similar to that in Gunn to implement a telephone communication. Do teaches the system accepting a numeric keys for a telephone call known in the art to comprise ten keys [(XXX) XXX-XXXX] and further remembering the last entered 10 keys for a redial function. Do further teaches, in column 7, lines 49-54, the system further comprising a dial button for initiating a call and obviously creating a new last dialed number for later redial. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Do before him at the time the invention was made to modify grouped buttons of Gunn to be associated with particular applications such as a telephone application, as did Do. One would have been motivated to make such a combination because different applications have different relevant keys, in this case the numeric pad, as taught by both reference is utilized in Do to conduct a phone conversation, with past dialed

Art Unit: 2173

numbers being preserved for further use. However, neither Gunn nor Do teach memorizing the button displayed in focus for later use.

Cirne teaches a system where user interface items are grouped and presented to a user as a group, where one of the items of the group is given particular focus (see column 4, lines 65 through column 5, line 20), similar to that of Gunn, but further teaches saving a current focus item in a group window, so that when the dialog returns to the window the focus can be directed to the same item. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Cirne before him at the time the invention was made to modify grouped icon display with specific focus of Gunn to include the memorization of a groups focus as did Cirne. One would have been motivated to make such a combination because this allows for directing a focus to the same item when a group window is reopened.

31. With regard to claim 18, which teaches wherein the display control section comprising a button memory unit adapted to memorize the button which was displayed in focused state immediately before the ten keys are erased from the monitor, and wherein the display control section displays the button memorized in the button memory unit in focused state as the specific button, Gunn teaches, in paragraphs 125 and 128, a specific button of the changed to group of buttons is displayed in or near the center providing it with specific focus. Do teaches, in paragraph 7, lines 36-60, remembering the last entered 10 keys for a redial function. However, neither Gunn nor Do teach memorizing the button displayed in focus for later use. Cirne teaches a system where user interface items are grouped and presented to a user as a group, where one of the

items of the group is given particular focus (see column 4, lines 65 through column 5, line 20), similar to that of Gunn, but further teaches saving a current focus item in a group window, so that when the dialog returns to the window the focus can be directed to the same item. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Cirne before him at the time the invention was made to modify grouped icon display with specific focus of Gunn to include the memorization of a groups focus as did Cirne. One would have been motivated to make such a combination because this allows for directing a focus to the same item when a group window is reopened.

32. With regard to claim 27, which teaches wherein the display control section comprises a ten key memory unit adapted to store the button of the ten keys displayed in focused state immediately before the button displayed in focused state is changed by the button change section from the button of the ten keys to the communication button, and wherein the display control section displays the button stored in the ten key memory unit in focused state as the specific button, Gunn teaches, in paragraphs 125 and 128, a specific button of the changed to group of buttons is displayed in or near the center providing it with specific focus. Do teaches, in paragraph 7, lines 36-60, remembering the last entered 10 keys for a redial function. However, neither Gunn nor Do teach memorizing the button displayed in focus for later use. Cirne teaches a system where user interface items are grouped and presented to a user as a group, where one of the items of the group is given particular focus (see column 4, lines 65 through column 5, line 20), similar to that of Gunn, but further teaches saving a current

focus item in a group window, so that when the dialog returns to the window the focus can be directed to the same item. It would have been obvious to one of ordinary skill in the art, having the teachings of Gunn and Cirne before him at the time the invention was made to modify grouped icon display with specific focus of Gunn to include the memorization of a groups focus as did Cirne. One would have been motivated to make such a combination because this allows for directing a focus to the same item when a group window is reopened.

Conclusion

33. The prior art made of record on form PTO-892 and not relied upon is considered pertinent to applicant's disclosure. Applicant is required under 37 C.F.R. § 1.111(c) to consider these references fully when responding to this action. The documents cited therein teach graphical display of keys where a particular key is placed as a focus element.

34. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dennis G. Bonshock whose telephone number is (571) 272-4047. The examiner can normally be reached on Monday - Friday, 6:30 a.m. - 4:00 p.m.

35. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kristine Kincaid can be reached on (571) 272-4063. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
